

No reflections · No straylight · Maximum brightness

1 1/4" + 2" - Premium Colored Glass-Filters

fineoptically polished / 7-layer MC-coated

All substrates fineoptically polished. These filters by far supersede the mediocre quality of common „flame polished“ color filters.

Fineoptical polish and 2 mm thickness allows these filters to be inserted anywhere into the optical path without introducing astigmatism or other defects. For instance they can be used in front of a binocular viewer without degrading the image in any way.

Substrates are free of striae and planeparallel polished to within 30 seconds of arc. This eliminates any double images or ghosting due to wedge errors in the glass.

The sets comprise three longpass and three genuine bandpass filters, which act similar to a nebula filter, so that only a small portion of the visual spectrum is transmitted to emphasize certain planetary surface detail.

The sets consist of following colors (Note the spectral trace for each color!)		
	1 1/4"	2"
■ Dark blue (435 nm) # 2458302 # 2458312		
■ Bright blue (470 nm) # 2458303 # 2458313		
■ Green (500 nm) # 2458304 # 2458314		
■ Yellow (495 nm) # 2458301 # 2458315		
■ Orange (570 nm) # 2458306 # 2458316		
■ Red (610 nm) # 2458307 # 2458317		

Transmission efficiencies for the three longpass-filters (Yellow, orange and red) peaks at 98%, while the efficiency for the three bandpass-filters peaks at almost 70 percent – unheard of for a simple colored glass-filter!

■ All filters have standard 1 1/4" or 2" eyepiece filter threads, tested and optimized to fit almost all eyepieces on the market. Each filtercell has a male as well as a female thread to allow stacking for narrower passbands or to combine with our UV/IR-Cut-filter. The combination of the red RG 610 and IR-Cut-filter (1 1/4" # 2459207 or 2" # 2459210) for instance results in an extremely narrow H- α passband-filter – at an incredibly cheap price.

■ The filter cell features the largest clear aperture of any 1 1/4" or 2" filter on the market – for complete freedom from vignetting at any focal length.

■ The front „crown“ incorporates milled notches, which makes handling and threading the filter an easy operation in the dark.

■ All surfaces are treated with a 7-layer Multi-Coating, featuring a mere 0.25% residual reflection. It is the most elaborate coating ever applied onto amateur color filters, resulting in a filter free of any false reflections under any incident angle of light.

■ As mentioned on www.cloudynights.com: LIGHT(-transmission) is **the hottest commodity** for all planetary observation. Especially during high magnification work „enough light“ is the deciding factor for the recognition of subtlest planetary surface detail, much more important than a horde of different filters of mediocre execution.

Less is more:

7-layer MC-coatings not only provide a brighter image – most important of all – they prevent the softening effect of scattered light! Scattered light kills exactly those subtlest features in planetary detail that this filter business is all about. Painstaking attention to coatings and perfect optical figuring are simple reasons why the image contrast through these premium filters is so rock-hard.

Premium Color Filter-Set (6 pieces)

1 1/4" Item.-No.: 245 8300 € 120,-

2" Item.-No.: 245 8310 € 196,-

For purchasing individual Filters see Item.-No.'s at left. Prices for single filters are:

1 1/4" € 25,- 2" € 36,-

For best cleaning results we recommend:

OPTICAL WONDER™

Fineoptical Cleaning Fluid
 100 ml · Item-No.: 2905007

Super-Microfibre Cloth
 10 x 10 inch · Item-No.: 2905000
